

Stored procedures

database gestion

1. List the details of the employees of a given office as well as the information of the office they are assigned to. If the office has no employees, the office information will be displayed as well as NULL values in the fields corresponding to the employees.

The procedure has one input parameter which is the office number.

2. Now we want to make the output of the previous SP clearer. We are going to create an SP that is like the previous one but it shows the following text: “Details of office XX:”, where XX will be the office number.

3. Now, we want to evolve the output of the results and check if the office exists.

4. Obtain statistics on the number of orders and total amount sold by a certain employee (representative). If the representative has no orders, an empty table will be displayed.

5. Now, if the representative has no orders in table pedidos, display a message.

6. List all orders of a certain customer in a certain month and year.

7. SP with an output parameter. Write a procedure that returns how many orders a given representative has placed. If the representative has no orders in the table, it will return 0.
